SQL Monitor 3.5 release notes

July 23rd, 2013

New feature

SQL Monitor automatically creates a baseline against which you can compare previous metric activity. You can:

- Set the baseline to include metric data collected during single or multiple previous time ranges.
- Choose between two different views of the Analysis graph:
    - Lines view: each time range included in the baseline is represented by a separate line. This helps you to spot behavioral trends.
    - Regions view: shaded regions help you to quickly identify the areas where metric activity occurred most frequently, and shows whether your latest data pattern falls outside the normal limits for your server.

Known issue

The Analysis page may be slow if you're using Internet Explorer 7 and 8. For the best SQL Monitor experience, please update Internet Explorer.
