

# Using SQL Search in a new version of SQL Server Management Studio

If you already have SQL Search installed, and you install a new version of Management Studio, SQL Search **won't appear** in the new version of Management Studio.

To use SQL Search in the new version of Management Studio, you need to repair the SSMS Integration Pack Framework installation:

1. Open **Programs and Features**.
2. Right-click **SSMS Integration Pack Framework 1** and select **Repair**.

You should now be able to use SQL Search in the new version of Management Studio.

If SQL Search still doesn't appear in Management Studio after repairing the SSMS Integration Pack Framework, uninstall SQL Search and the SSMS Integration Pack Framework 1 and then reinstall SQL Search, which will also automatically reinstall the SSMS Integration Pack Framework 1.
