

New-SqlClone

New-SqlClone

Starts creating a clone from an image.

Syntax

```
New-SqlClone [-Image] <ImageResource> [-Name] <string> [-Location] <SqlServerInstanceResource>
[<CommonParameters>]
```

Description

The New-SqlClone cmdlet starts creating a clone from an image and outputs details of the creation operation.

This cmdlet returns a OperationResource which can be passed to the Wait-SqlCloneOperation cmdlet.

Connect-SqlClone must be called before this cmdlet.

Parameters

-Image <RedGate.SqlClone.Client.Api.Objects.ImageResource>

Specifies the parent image that will be cloned. The Get-SqlCloneImage cmdlet can be used to get an ImageResource.

| | |
|----------------------------|----------------|
| Aliases | None |
| Required? | true |
| Position? | 0 |
| Default Value | None |
| Accept Pipeline Input | true (ByValue) |
| Accept Wildcard Characters | false |

-Name <System.String>

Specifies the database name of the clone. This needs to be a unique database name within the specified SQL Server instance. This value has a maximum length of 128 characters.

| | |
|----------------------------|-------|
| Aliases | None |
| Required? | true |
| Position? | 1 |
| Default Value | None |
| Accept Pipeline Input | false |
| Accept Wildcard Characters | false |

-Location <RedGate.SqlClone.Client.Api.Objects.SqlServerInstanceResource>

Specifies the SQL Server instance that the clone will be created on. The Get-SqlCloneSqlServerInstance cmdlet can be used to get a SqlServerInstanceResource.

| | |
|----------------------------|-------|
| Aliases | None |
| Required? | true |
| Position? | 2 |
| Default Value | None |
| Accept Pipeline Input | false |
| Accept Wildcard Characters | false |

<CommonParameters>

This cmdlet supports the common parameters: -Verbose, -Debug, -ErrorAction, -ErrorVariable, -OutBuffer, and -OutVariable. For more information, see <http://technet.microsoft.com/en-us/library/hh847884.aspx>.

Inputs

The input type is the type of the objects that you can pipe to the cmdlet.

- **RedGate.SqlClone.Client.Api.Objects.ImageResource**

Specifies the parent image that will be cloned. The Get-SqlCloneImage cmdlet can be used to get an ImageResource.

Return values

The output type is the type of the objects that the cmdlet emits.

- **RedGate.SqlClone.Client.Api.Objects.OperationResource**

Examples

----- EXAMPLE 1 -----

```
Connect-SqlClone -ServerUrl 'http://sql-clone.example.com:14145'
$image = Get-SqlCloneImage -Name 'AdventureWorks-20170106110745'
$SqlServerInstance = Get-SqlCloneSqlServerInstance -MachineName WIN201601 -InstanceName SQL2014
New-SqlClone -Name 'AdventureWorks-clone1' -Location $SqlServerInstance -Image $image
```

This example starts creating a new clone named 'AdventureWorks-clone1' on WIN201601\SQL2014 based on the image named 'AdventureWorks-20170106110745'.

----- EXAMPLE 2 -----

```
Connect-SqlClone -ServerUrl 'http://sql-clone.example.com:14145'
$image = Get-SqlCloneImage -Name 'AdventureWorks-20170106110745'
$SqlServerInstance = Get-SqlCloneSqlServerInstance -MachineName WIN201601 -InstanceName SQL2014
$image | New-SqlClone -Name 'AdventureWorks-clone1' -Location $SqlServerInstance | Wait-SqlCloneOpeeration
```

This example uses the pipeline operator to create a new clone and waits for the creation to complete before returning.
