

Get-SqlCloneImage

Get-SqlCloneImage

Gets image details from a SQL Clone Server.

Syntax

```
Get-SqlCloneImage [[-Name] <string>] [<CommonParameters>]
```

Description

The Get-SqlCloneImage cmdlet gets details of clone images from a SQL Clone Server.

Without parameters, this cmdlet gets details of all images. You can specify a particular image by name or use a wildcard filter.

This cmdlet returns a ImageResource which can be passed to the New-SqlClone cmdlet for creating a clone from the image.

Connect-SqlClone must be called before this cmdlet.

Parameters

-Name <System.String>

The name of the image. Wildcards are permitted. If no name is specified then details of all images will be returned.

Aliases	None
Required?	false
Position?	0
Default Value	None
Accept Pipeline Input	true (ByValue)
Accept Wildcard Characters	false

<CommonParameters>

This cmdlet supports the common parameters: -Verbose, -Debug, -ErrorAction, -ErrorVariable, -OutBuffer, and -OutVariable. For more information, see <http://technet.microsoft.com/en-us/library/hh847884.aspx>.

Inputs

The input type is the type of the objects that you can pipe to the cmdlet.

- **System.String**

The name of the image. Wildcards are permitted. If no name is specified then details of all images will be returned.

Return values

The output type is the type of the objects that the cmdlet emits.

- **RedGate.SqlClone.Client.Api.Objects.ImageResource**

Examples
